C++ for GAME PROGRAMMERS

Provides game programmers with a comprehensive guide to C++ for game development

Goes beyond the basics of C++ and concentrates on how to use it effectively for games

Uses up-to-date technologies, including STL

Covers both PC and console development

Copyrighted Material

NOEL LLOPIS

BEGINNING BIRDWATCHER'S BOOK WITH 48 STICKERS

Sy Barlowe

20 lectures on algorithmic game theory.

Imagine that it is a soldier placed on a defensive line. Tomorrow will be a great battle. There are two possible results of the battle (victory or defeat), and two possible results for you (survive or die). Clearly, its preference is to survive. If your line is violated, you will die. However, even if the defensive line holds, you can die in battle. It seems that your best option is to escape. But if you do so, those who stay for the tremors and fight can die. You know that everyone else in the defensive line is thinking about the same thing. If you decide to stay and cooperate, but everyone else escapes, certainly die. This problem has plagued military strategists since the UNCIO of War. That is why there is usually a new condition entry into the equation - if you escape or defect, you will be shot like a traitor. Therefore, the best chance you have to survive is to keep your position on the line and fight for the victory. How does this relate to game theory? Game theory is not studying how to win a chess game or how to create a RPG game scene. Often, game theory does not even relate remotely to what you would consider to be a game. In its most basic, the theory of games is the study of how people, companies, or nations (referred to as agents or players) determine strategies in different situations in the face of actual strategies activated by other agents or players. Game theory assumes that agents make rational decisions at all times. There is some failure in this assumption: what goes on to the irrational behavior by the majority of society (a watery of nuclear weapons, for example) is considered quite rational by the patterns of game theory. However, even when the game of the theory of the game produces counter-intuitive results, it still produces amazing insights on human nature. For example, members of society only cooperate with each other because of material gain, or is there more for him? Him? Help any need if you hurt you in the long run? To learn why a rational person must behave egomously, continue for the next section. Teacher: Aaron Roth Tas: Joseph Goodman, Jialin Wang, William Wang Title: Thursday / Thursday 3: 00-4: 30 room: DRLB A8 GENERAL VISION; In this course, we will have a algorithm perspective on The problems in the theory of the game. Let's consider questions such as: How should an auction for scarce goods structured if the seller wants to maximize your recipe? What bad the tremors will be spoiled if drivers each self-tasting attempt to minimize their time of commutation by comparing with if a benevolent dictator directs the tremors? How can couples be paired so that no couple want to exchange partners in retrospective? How can we find renal cebian cycle cycles to encourage people to participate in the exchange without using money? How can we encourage men from time to lying on Susana and Rain? How can we define any prices for all goods to be sold, and everyone receives their favorite good? Prereqs © -Requisites: This will be a course of mathematically rigorous theory for students of advanced graduation. Students must have taken, or simultaneously taking a course in algorithms (such as Cis 320), to be mathematically mature, and to be familiar with the Big-O notary. The course prevails in the theory of the game is, but it is not necessary. Everything will be presented from the first principles. Objectives and Graduation: The objective of this course is to give students a rigorous introduction to the game theory from a perspective of computer science, and prepare students to think about intereh ECONOMIC AND ALGOROATMICS from the perspective of incentives. Graduation will be based on the participation (5%), problem sets (45%), due term (20%), and final examination (30%). Text Book: No Book of necessary. Several recommended books are Twenty Lectures on Algorithmic Game Theory, Algorithm Game Theory and Ethical Algorithm (Chapter 3). Office hours and discussion: Office hours: office: Piazza We will be using Piazza to discuss class material, answer questions, and make announcements. The Piazza page for NETS 412 is Apiazza.com/uenp/spring2020/nets412. Students are encouraged to ask questions about the material on Piazza so that everyone can benefit and contribute to their answers. Topics Covered: Part 1: Game Theory and Game Dynamics Quick introduction to game theory: Zero sum and general sum games, Minmax strategies, Nash equilibrium, correlated equilibrium. Game Dynamics: Weighted Majority AlgorithmGame Dynamics: Bandit Algorithms Game Dynamics: converging to Nash equilibrium in zero sum games; Game dynamics converging to correlated equilibrium in general sum gamesGame Dynamics: Best Response Dynamics and Potential Games. Price of anarchy and price of stability: Definition, routing games, hoteling games More if time allows.. Part 2: Assignment Problems and Mechanism Design Stable Matchings and the Deferred Acceptance AlgorithmMarket Equilibrium and Gross Substitute PreferencesAuction basics: First price auctions, second price auctions, truthfulness Maximizing welfare: The VCG MechanismAuctions and Approximation AlgorithmsCombinatorial AuctionsOnline Auctions
